The study site is accessed from English Camp. From the North side of the parking lot there is a trail that takes you to the shore. Then, follow the shore to the east around one small headland to the second. The mud is deep around the rocks. This site is part of the work on long term monitoring of *Crassostrea gigas* density, recruitment, and size, and local biodiversity of macrophytes and macroinvertebrates.
Close-up of Site
Most of the rocks are under water
The shellfish farm is visible across the water
